And you can convert PSD files to a non-lossy format that web browsers can display, which can potentially increase your website's speed. To generate consistent results, you'll need to set the white balance when you shoot. There are now nine presets, but again, not all of them are necessarily the most ideal settings for your new camera. Navigating the various settings is a breeze, but you'll need to spend some time on the settings browser before you have a good mental map of what you're doing. In most cases, there's little effort necessary to fine-tune your camera and software. However, I did find myself wishing there was a quicker way to set the white balance.
